

Engineered Wood Flooring

Custom plank engineered wood flooring is real wood built for high performance and lasting durability. The top layer is real hardwood that looks and feels like a traditional solid wood floor, yet is a far better choice for durability and price.

Engineered wood flooring (EWF) is manufactured with a cross-grained construction, making it stronger than solid wood, more dimensionally stable, and less likely to expand or contract when exposed to changes in temperature and humidity. With the use of hot-press technology, it is ideal for both nail and glue-down applications. This flooring is recommended for dimensional stability over solid flooring options.

Strong enough for both residential and commercial settings, our wide planks create a striking and distinctive look, allowing the grain and personality of the hardwood to shine through.

Select White Oak

Rustic Walnut

SPECIFICATIONS:

- Species: White Oak, Red Oak, Hickory, Hard Maple, Walnut
- Grades: Rustic (*sound, knotty*) and Select (*dime-sized tight defects allowed from FAS/1F lumber*)
- Grain Patterns: Rift & Quartered, Plain Sawn
